

**FINARTS**  
Term 3, AY 2025 – 2026  
Term Project Details

Group project: Replication of a finance journal article to apply the concepts of regression analysis.

1. The group must choose a finance article from a journal with an A\*, A, or B classification from the Australian Business Deans Council (ABDC) Journal Quality List.
2. The group must replicate the article that they have chosen. “Replication” may mean any of the following:
  - i. Using the same exact sample and variables in the selected journal article to validate the results.
  - ii. Modifying the sample (e.g., using the ASEAN countries instead of the US, or extending the study period) to test the generalizability of the original findings across different markets or time periods.
  - iii. Modifying the model: Adding a new control variable or using a different econometric technique (e.g., switching from OLS to Fixed Effects) to see if the original relationship holds steady.
  - iv. Other modifications subject to approval.
3. The group must identify the theoretical foundations that will guide the hypotheses that will be tested in the replication.
4. A portion of the analysis must include data downloaded from LSEG Workspace.
5. The group will apply the statistical concepts studied in the course by presenting the following:
  - i. Presentation of the Null ( $H_0$ ) and Alternative ( $H_a$ ) hypotheses based on the identified theory.
  - ii. Descriptive statistics of the data used.
  - iii. Results of the econometric tests (e.g., t-test, correlation, regressions).
  - iv. Discussion of the results (e.g., whether the empirical evidence supports or contradicts the underlying financial theory).

Key dates:

1. In-class progress update: July 17, 2026
2. Submission: August 7, 2026 at 11:59 PM.

Submission format: Written report. More details on the format of the written report to be released soon.
